

Release Notes for Lender Desk 4.6

Integration of VIN Specific Programs for FCA for qualificationsMet, maxGuaranteedCash & maxConfiguredCash

- When a user submits an FCA VIN to LenderDesk it will return VINspecific incentives when creating maxGuaranteedCash and max ConfiguredCash values.
- Plus, it will show VIN specific incentives if they are available via the qualificationsMet attribute = true.

Additional of Balloon Residuals to LenderDesk

- All available balloon residuals will be returned in LenderDesk when balloon finance programs are offered for the vehicle and geography submitted to the service.
 - When a balloon finance program is available the service will allow it to be stackable with maxGuaranteedCashTotal a lease residual.

maxGuaranteedCashTotal to Consider VIN Specific Programs

- When a user submits a VIN to LenderDesk the service will add in the maxGuaranteedCashTotal all cash back programs requiring a specific VIN where the VIN requirement matches the VIN submitted.
 - Note: maxGuaranteedCashTotal includes all programs where marketScope = guaranteed, and qualificationsMet = true.

Enhanced Previous Ownership for Desking Integration

- Can now submit a “previousOwnershipStyleID” to the service so previous ownership cash programs can be considered in the maxConfiguredCash calculation.

Utilize Engineered VIN Data for VIN Submission when Build Data is not Available

- When a VIN is submitted to the service, the service will make use of engineered data to reduce it to a single styleID even when build data is not available.

Implementation of Region & Vehicle Endpoints for Use with Bundle Service

- The timestamp associated with each country, division and model year will update when a change has been made to a division’s vehicle or program or region

- And, revision codes indicate what revision the division's vehicles, programs and regions are at so you know when you get new data and what current data have been cached.

Added "useConsumerCash" flag in offers object

- Addition of new useConsumerCash attribute to indicate to the user that they should check the consumerCash object for stackable cash.

Make Parsable Previous Ownership details

- User is able to easily identify when a vehicle qualifies for a previous ownership program with the addition of minimum model year, maximum model year, division and models.

Removed maxGuaranteedCash and kprograms in offers object for independent banks

- Ensure the response includes the "consumerCash" object even if the transType of cash is not specified (i.e. if user submits the transType as lease or loan, and a non-captive lender is offering a lease or loan program, then the consumerCash object needs to be returned)

Expand Offers Object to Include Category Type and "institutionDesc"

- For ease of integration and to reduce the number of look ups needed to be done in the response to get all relevant program information, the "category" attribute will be added to each program in the offers object

Added Previous Ownership Details Query String Parameter

- A query string parameter of previousOwnershipDetails (true/false) added for user to indicate that they do not want previous ownership program details to show in the response.

Added enableMergingResidualsWithLease flag in RCRM

- In order to split Lease and Residuals in LenderDesk we added residual program IDs (tagged with the lease program) added to the response with all the program attributes included.

Added includeExpired Parameter to have expired programs returned in response

- New includeExpired parameter can be used to have expired programs returned in the response.

Enhanced "vehicles" Object to Include Additional Vehicle Details

- Includes all the high level information about the vehicle

Added new endpoint: /divisionCodes

- A new endpoint will be set up returning all available division codes.

Determine & Capture "Distinct Vehicles" in DB Table

- For a vehicle to be considered distinct / unique, the vehicle needs to decode to a trim AND specific options, with the specific options influencing the deal scenario that can be created for the vehicle.
